

watering schedule

Beginning after the first eradication (step 2):

After the initial Roundup® application water for 30 minutes every third day** each treated area. This will continue for 6 to 8 weeks through the second Roundup application until the seeding stage begins.

After aeration and seeding (step 5):

It is essential to water each of the seeded areas during germination of the seed for 30 minutes **every day** for two weeks.

Continued watering (step 6):

From the third week after seeding to mid October (until the first heavy frost) water for 30 minutes every third day** in each of the seeded areas. This will help establish a hearty root system prior to winter.

Mowing note:

The first mowing of the young grass should occur approximately three weeks after seeding. Thereafter, mow each week as normal. When leaves drop in the fall bag your leaf and turf clippings so your lawn can continue to receive sunlight and establish roots into the winter months.

****Note: It is essential that the soil stays properly saturated. Lawnco advises that during conditions of high heat, excessive sunlight, high winds and drought the watering schedule for steps 2 and 6 may need to be adjusted to every other day. Conversely, you may want to water less in times of cooler temperatures, overcast or shade conditions, and during high rainfall or humidity.**

renovation

lawnco

“My lawn was a tangle of Bermuda, now I have a lush green lawn that is completely weed free.”

There's only one way to take back your yard after Bermuda grass has established itself...

renovation.

One Bermuda plant can take over 90 square feet of lawn in just a single season. If 30% to 50% of your yard is covered with Bermuda you are a candidate for renovation. Manage your infestation with a program of removal. Lawnco turf renovation is a proven process with a record of results. Renovation is an eight week program that returns your yard to a lush vista of green fescue.

Eight weeks? Why so long? Bermuda grass control requires completely killing the whole plant - roots and all. Growing quickly, its roots can burrow up to 24" deep and if broken or chopped they form new plants. Tenacious, hard to remove, invasive and competitive grasses like Bermuda, Bent grass and Nimblewill grass can take over a lawn quickly if left alone. Proper eradication is a committed effort, and Lawnco takes the time to insure your lawn becomes a beautiful (Lawnco) lawn. Lawnco wants your lawn to stay healthy too; with a program of scheduled applications we can help you maintain a healthy looking lawn all year round.

After any renovation remember that regular inspection of your yard is necessary to insure that unwanted grasses do not re-establish themselves.

renovations with a proven record of results so you can take back your lawn

phase one

1) evaluation:

Lawnco inspects your lawn to determine if renovation or one of our other rejuvenation services is appropriate for your lawn. If Bermuda, Bent grass or Nimblewill grass are present in large amounts renovation is the only resolve for your lawn issue.

2) eradication:

Using a non-selective herbicide to kill all plant material and their roots, this part of the process requires a minimum of two applications for most yards. A second application is needed to assure the elimination of all regrowth plant material.

3) watering:

Daily watering is essential to move the herbicide to the weed roots and promote any growth of remaining grasses and is necessary to ensure a complete eradication.

phase two

4) regrowth:

Second application of herbicide and more watering. Lawnco will evaluate when the yard is ready to be seeded and if grading or drainage issues need to be addressed prior to seeding. Additional eradication applications may be necessary if there was a heavy infestation.

5) seeding:

A calibrated power seeder measures the perfect amount of seed while the soil is aerated to promote oxygen exchange. A time-released fertilizer is applied to ensure a proper fertilization of the new lawn.

6) watering:

Eight weeks or more of regular watering is needed to stimulate root growth and ready the lawn for winter. Lawnco reevaluates after 12 months to discuss any questions you have or needs you have for your Lawnco lawn.
